Lasersystems for subsurface engravings

Our developments revolutionize the marking of different materials by laser technology. Conventional methods are limited to the marking of the materials' surface. With our laser subsurface engraving method the surface remains untouched. The desired marking is carried out inside the material.

The laser beam will be precisely focused in order to keep the finest formations and details of the masters. Every design is represented point by point and with a clear structure. We call this method "Vitrography". Two dimensional as well as three dimensional designs from all areas can be engraved. The result will convince you with its pin sharp quality.

Company Profile of Vitro Laser Solutions UG

A service of glasssglobal.com, an affiliate of glasssglobal group.
